

ORE HAUNT

Know the miners. Read the rounds.

Seeker-exclusive intel for ORE miners — the mineable token protocol on Solana.

CLOCK IN · SOLANA MOBILE HACKATHON

BY RAARU.SKR

PITCH DECK · OCT 2026

THE PROBLEM

ORE rounds settle every ~90 seconds — and miners deploy blind

- **The result is public. The story never is.** Every round ends on-chain, but who played, how they played, and what it cost is scattered across thousands of transactions.
- **Miners repeat the same rounds on instinct** — no record of which wallets crowd which tiles, round after round.
- **Yesterday's rounds might as well never have happened.** The chain remembers everything; nobody had built the memory miners can actually read.

THE PRODUCT

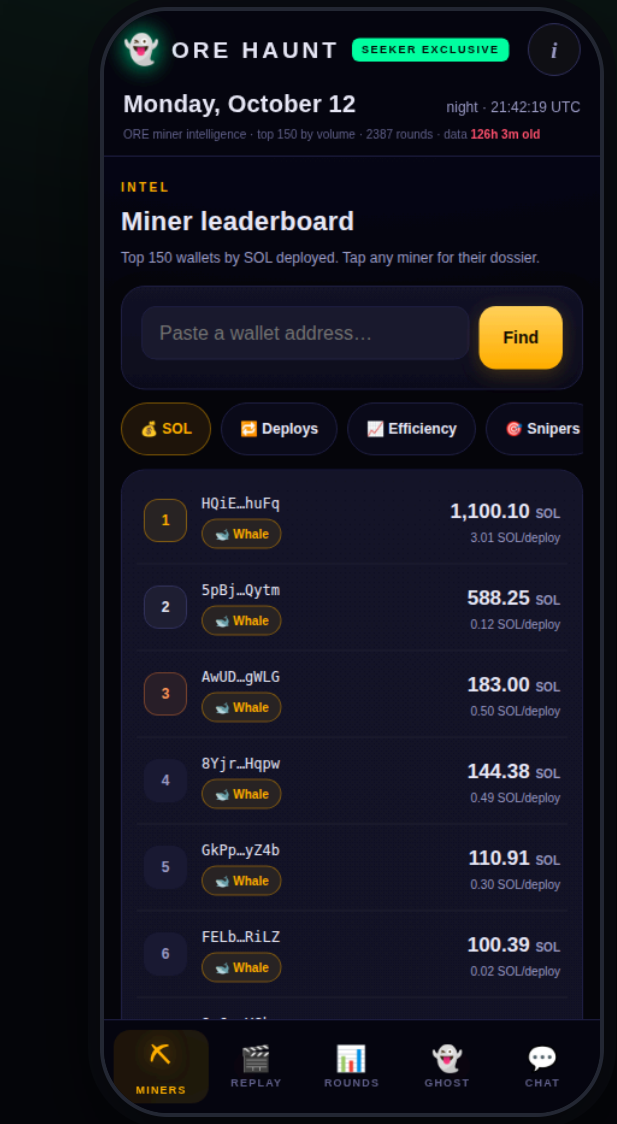

A dossier on every miner. The full record of every round.

150
MINERS PROFILED

200
ROUNDS EXPLORED

8
CINEMATIC REPLAYS

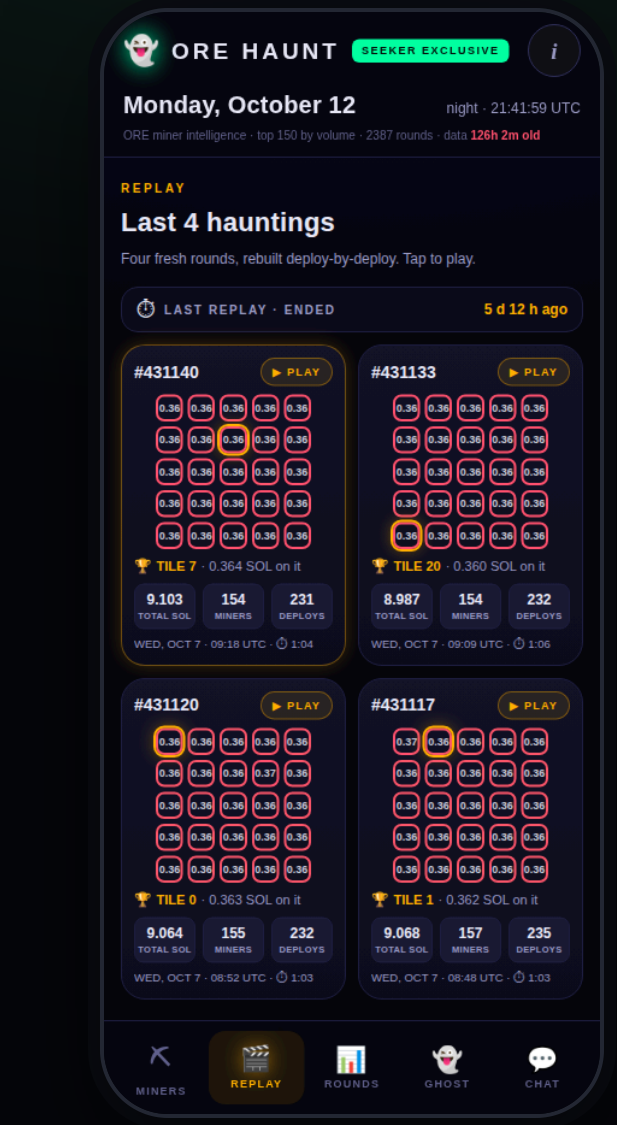

- **Leaderboard + dossier per miner** — strategy read, tile fingerprint, full history.
- **Miner Compare** with fingerprint heatmaps, a **cost-of-play lens**, and a session watchlist for the miners you track.

REPLAYS

Watch rounds play out, deploy-by-deploy

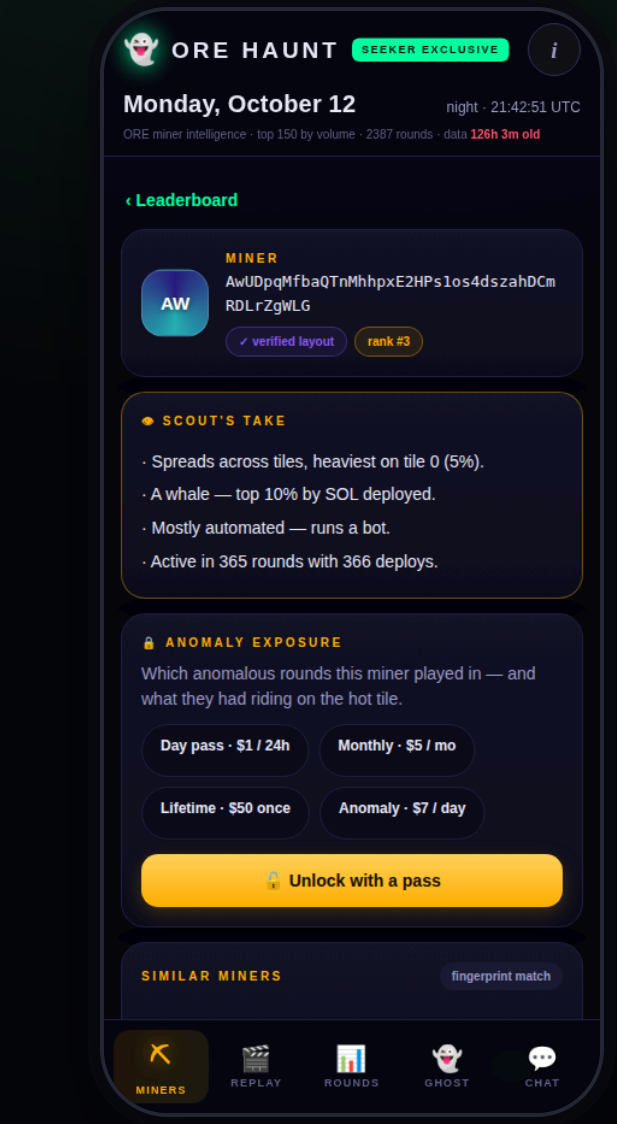

- **8 cinematic replays** rebuilt from chain data — every deploy lands on the board in order, with live telemetry.
- **New: the Last-4 page** — the four freshest replays on one screen, full information on every card.
- A **live timer** sits above them, counting the time since the last replay ended. The record always knows how fresh it is.

ANOMALY

28 anomaly signals — and who was standing on the hot tile

- HAUNT's own detector scanned the live 200-round window and flagged **28 signals**.
- **Exposure is written per miner** — open any dossier and see which anomalous rounds they played, and what they had riding on it.
- **ANOMALY tier: $7 · 100 slots · rolling 24h.** Capped at 100 slots per rolling 24 hours; the server-side slot ledger is built and activates when the backend hosts.

INTEGRATIONS

Integrated with the stack it serves

ORE protocol	The data foundation — Board, Round, and Miner accounts decoded from source-verified layouts. **222 rounds collected live today**; detector validated on a 2,433-round research corpus.	LIVE
ORE, the asset	Pay-in-ORE checkout: Solana Pay SPL links to the treasury, verified by token-balance delta (≥99%). **Pay with what you mine.**	BUILT
Solana Pay	The solana: link standard carries all three checkouts — SOL, ORE and SKR — with amount, memo, and SPL-token parameters in one link.	BUILT
Jupiter Price API v3	Live SOL/USD, ORE/USD and SKR/USD pricing behind the USD-denominated pass tiers.	LIVE
AllDomains ANS · .skr	Treasury wallet resolved on-chain from **raaru.skr**. The .skr identity layer — companion, chat handles — builds on it.	LIVE PROTOTYPE
Solana RPC + WebSocket	Board subscriptions plus batched account reads — **100 rounds in one call**. The transport under the $0 pipeline.	LIVE
api.ore.com	The ORE team's own API — an independent cross-check that validated the pipeline's decoding **to the lamport**.	LIVE
Mobile Wallet Adapter	Wired in the Android shell (Kotlin, MWA clientlib 2.0.8) packaging HAUNT for Seeker. Web checkout rides Solana Pay.	STAGED
Agent Data API · x402	Snapshot API + MCP tools serving HAUNT intel to AI agents, with HTTP-402 payment quotes. Payments gated.	BUILT

LIVE = RUNNING TODAY · **BUILT** = IN THE BUILD · **STAGED** = IN THE APK PROJECT

WHY THIS QUALIFIES

Remove ORE, and there is no product left

> **The matched prize** goes to the best qualifying ORE integration among the Top 10. HAUNT's claim: ORE is not a feature in this app — it is **the subject, the data source, and the payment rail**.

- Protocol data decoded from **source-verified layouts** — read from the program's own accounts.
- A **live pipeline** collecting the protocol's V4 rounds today — poller, census, scanner. This build ships its live-collected snapshot; continuous refresh follows post-launch.
- Payments **denominated and settled in ORE** itself, verified against the treasury's balance.
- The operator's own API (**api.ore.com**) used as the decoding cross-check — matched to the lamport.

INNOVATION

A $0 collection architecture — ~2 RPC calls a round — plus anomaly detection run over the protocol's own rounds.

UX

Nine integrations felt as one product — replays, dossiers, pay-in-ORE — never a stack diagram.

STICKINESS

The data compounds daily: every round collected deepens the dossiers and the watchlist + companion loops.

PRESENTATION

This deck, a working APK, and live pipeline numbers — every claim carries its status tag on the previous slide.

BUILT FOR SEEKER

One device, one thumb, .skr-native from the first screen

- **Mobile-first throughout** — safe-area aware, 44px targets, designed on real phone viewports, not shrunk from desktop.
- **GHOST tab:** a .skr companion that grows with your mining (local prototype). **CHAT tab:** a .skr community floor (local preview). Identity is the direction, honestly labeled while it matures.
- **Solana Pay checkout built**, treasury set to the owner's raaru.skr wallet.

> Status: working build, treasury set — this submission is the demo milestone. Deployment follows CLOCK IN.

BUSINESS

Free intel for everyone. Depth for the obsessed.

Free	$1	$5	$50	$7
LEADERBOARD · EXPLORER	DAY PASS	MONTHLY	LIFETIME	ANOMALY · 100 SLOTS

- **Passes unlock the depth** — full dossiers, Miner Compare, anomaly exposure, the works.
- **Second act (roadmap): the HAUNT Data API** — the same intel packaged for agents and builders. Snapshots are already built; payments stay gated until the backend is hosted.

WHY IT WINS

Four criteria. Four answers, all evidence.

STICKINESS & PMF

Rounds settle every ~90 seconds, forever. HAUNT is the standing record miners check between them — 150 dossiers and 200 rounds of reasons to come back.

UX

Every screenshot in this deck is the real app on a real phone viewport. Assertion-led screens, one-thumb navigation, zero dead ends.

INNOVATION / X-FACTOR

An intel layer where none existed: per-miner anomaly exposure, deploy-by-deploy replays, and a $0 pipeline that reads the chain for ~2 calls a round.

PRESENTATION & DEMO

A working build you can open today, a live data pipeline behind it, and claims we verified — including the draw itself: chi-square tested, provably uniform. HAUNT sells the record, never predictions.

The rounds don't stop. Now they have a memory.

- **Next:** deployment to the dApp Store, backend hosting to switch payment verification server-side.
- **Roadmap:** NIGHTSHIFT — an EV-mining companion (spec complete) that drinks straight from the live pipeline HAUNT switched on today.
